- Framework¹ itself requires JAVA 8 with maven.
- Simple cloning is not enough, because there are some missing dependencies (not up to date) in *pom.xml* file.
- Compilation needs to be processed without the execution of internal tests (-DskipTests).
- Firewall problems might occur during execution. At least port 2404 (default) needs to be enabled.

¹<https://github.com/PMaynard/ICS-TestBed-Framework>

- HMI (Human-machine interface) – periodically controlling other hosts.
- RTU (Remote Terminal Unit) – represents node for connection between sensors and HMI.

- Compilation creates *jar* archive, which will open a shell command line after execution.
- Any desired IP information is to be set in this stage before the execution of a single device.
- Default settings work for local-host communication.

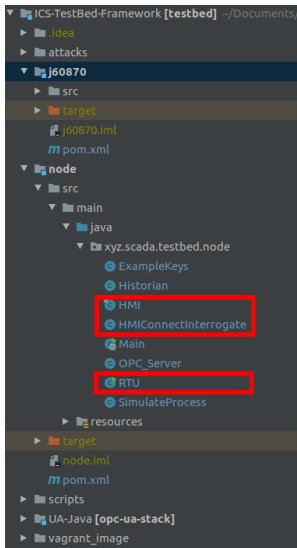

HMI

```
hmi: Start HMI.  
hmi-common-address: Set IEC104 Common Address to query.  
hmi-iec104port: Set IEC105 port.  
hmi-interval: Set interval query (MS).  
hmi-show: Show current HMI configuration.  
remote-hosts: Set hosts to connect to.
```

RTU

```
enable-opcua: Enable OPC-UA  
rtu: Start RTU.  
rtu-iec104port: Set IEC104 Port.  
rtu-listen: Set listen interface.
```

- The behavior of each device needs to be hard-coded in the corresponding class (does not require any IP information)

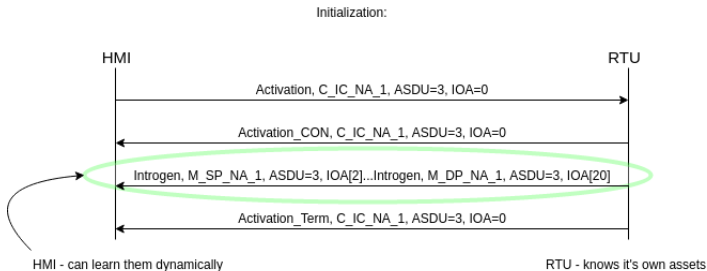

Building standard behavior from captured traffic requires important values such as:

- Asdu
- Type of command
- TypeID of command
- OA – Address of originate
- IOA – Object(s) of interest for command

```
> Frame 39: 70 bytes on wire (560 bits), 70 bytes captured (560 bits)
> Ethernet II, Src: AsustekC_56:0b:54 (00:22:15:56:0b:54), Dst: ZatAS_00:09:05 (00:16:d1:00:09:05)
> Internet Protocol Version 4, Src: 10.20.102.1, Dst: 10.20.100.108
> Transmission Control Protocol, Src Port: 46413, Dst Port: 2404, Seq: 133, Ack: 1689, Len: 16
> IEC 60870-5-104-Apci: <- I (6,45)
v IEC 60870-5-104-Asdu: ASDU=10 C_RC_NA_1 Act IOA=1 'regulating step command'
  TypeId: C_RC_NA_1 (47)
  0... .... = SQ: False
  .000 0001 = NumIx: 1
  ..00 0110 = CauseTx: Act (6)
  .0... .... = Negative: False
  0... .... = Test: False
  OA: 0
  Addr: 10
  v IOA: 1
    IOA: 1
  > RCO: 0x02
```

- From data collected this way it's possible to generate behavior for each device to be virtualized.
- RTU device is represented by a finite automaton, that can provide information about its assets any time it's asked for.
- HMI device is an initiator of communication and can learn about assets that can be provided by RTU dynamically during INIT state (does not need to be hard-coded as for RTU).

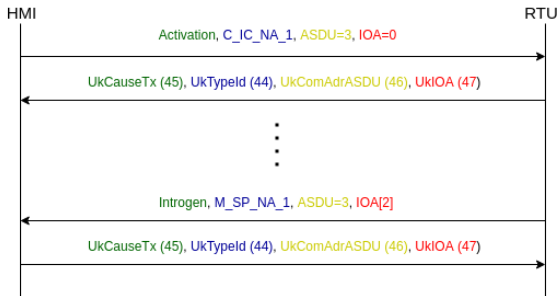

- As initiator HMI is responsible for cyclic communication, so that needs to be hard-coded on the HMI part.
- It means that HMI consists of sequence(s) of Activation commands based on captured traffic.
- HMI can be an initiator for more RTUs of multiple types (meaning that HMI can handle more parallel sequences).

Building virtual devices V.

Processing of unknown data

- Framework itself did not consist of any useful functions for processing data that is not corresponding in the scenario.
- From IEC104 specifications: Each device should be able to check incoming messages for unknown data obtained.
- My addition needed to be made to *Connection* class so that both types of devices can check its incoming message and react with a correct negative response if needed.

	Source no.1	Source no.2	Output (HMI cap)
Packets	105 (2 minutes)	174 (3 minutes)	19542 (2 days)
IEC104	57%	62.5%	50.5%

Start with emulation of attacks

- Packet drop-out
- Man-in-the-middle
- DDoS
- Scanning

Thank You For Your Attention !
